

SUPERthrive VITAMIN SOLUTION IS THE SECRET WEAPON FOR AWARD WINNING ROSES!

SUPERthrive is essential to safely transplant and grow beautiful, award-winning roses. Since 1940, our timeless vitamin solution has helped to produce countless queens of local, district, and national competitions. By supporting a healthy, strong root system, SUPERthrive provides nutrition and encourages your roses to make the most of the available nutrition in the soil.

DOSAGE AND INSTRUCTIONS

- **Planting** - use a bare-root soak of 1/4 tsp per 1 gallon of water. Soak for 15 - 30 minutes.
- **After Planting** - water with remaining SUPERthrive mixture.
- **Maintenance** - use 1/4 tsp per gallon applied at base.

Spectacular Success with Bare-Roots

Soaking your bare-root roses in a SUPERthrive mixture prior to planting will rehydrate and revive the roots. It will also prime them to be able to access the maximum nutrition available.

Roses are Thirsty

For proper maintenance, roses should be watered at least twice a week at the base of the plant. This translates to about an inch of water a week throughout the growing season.

If watering from above as opposed to drip irrigation, be sure to water in the mornings on days with the leaves can dry during the day. An occasional sprinkle over the leaves will mimic rainfall.
